

Load Burning_Embers_VFX.unity for an example scene which has the falling burning embers plus some background smoke set up. Alternatively, simply drag the required embers Prefab into your scene.

Burning_Embers_Fall.prefab has the embers falling slowing to the ground where as Burning_Embers_Volume.prefab has the embers floating and drifting within a set volume. This could be parented to you player character so that the embers always surround the player. Burning_Embers_Volume_Light.prefab is an alternative version of this but with less particles and effects, suitable for running on mobile.

Have fun!
